

dynaTrace APM

Continuous Application Performance Management

dynaTrace is the leader in Continuous Application Performance Management across the application lifecycle for business critical Java and .NET applications. Unlike first generation APM solutions that focus on the monitoring and triage of applications in production, dynaTrace extends APM to diagnostics and prevention throughout the application lifecycle – in development, in test, in staging and in production.

One system, highly automated, with a unique patent pending approach to deliver the industry's deepest end-to-end transaction instrumentation while keeping it light weight enough to run invisibly 7x24 in high volume production.

Drill to root-cause in 1/10th the time, reduce the number of application issues that slip through the cracks to production, provide unprecedented visibility into even your most complex applications, and accelerate time to market consistently.
