

iTKO LISA

The iTKO LISA Suite: Test, Validate & Virtualize Enabling Quality & Agility for today's complex software environments.

The iTKO LISATM product suite is a unified solution for testing, validating and virtualizing today's complex, rapidly changing business applications.

LISA provides quality coverage from design, to development and deployment, while eliminating cost and constraints throughout the software lifecycle. LISA speaks the language of most technologies found within enterprise IT, from rich web apps, to web services, integration layers, Java, databases and more. LISA is the leading quality framework for distributed, complex enterprise software, encompassing three key capabilities to help teams mitigate risk, and get better results from IT investments:

- » LISA Test: A complete and collaborative no-code testing framework that directly verifies all technology layers with a high level of automation, from web, to Java, SOA and Cloud services, so teams can thoroughly test with less effort, and better meet defined requirements.
- » LISA Validate: An "always ready" verification engine that continuously validates business processes and system performance, so all parties can assure that each software component supports all customer expectations and service policies, in an auditable form for improved IT governance.
- » LISA Virtualize: Captures and simulates the behavior of highly interdependent services, data and systems that teams must build and test their own software against, even when they may not have access to live or completed components.
